

So what is the real Cost for a Solar & Wind Future?

MASSIVE

Land clearing plus mining huge open pit mines for rare earth metals.

For a wind farm to reach the power capacity and to cover just 31,079 km² you need 30,000 tonnes of iron ore, 50,000 tonnes of concrete, 900 tonnes of non recyclable of plastic. To achieve the above multiply all that by approx 850 to get to the 85 gigawatts needed.

(Note: Victoria is approx. 227,444 km² land mass)

Renewables are nothing but pollution destroying OUR environment.

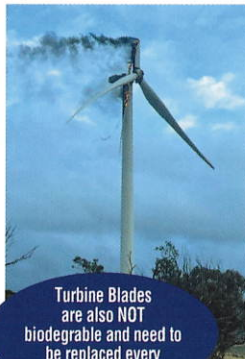

"California has been a pioneer in pushing for rooftop solar power, building up the largest solar market in the U.S. More than 20 years and 1.3 million rooftops later, the bill is coming due... Many are already winding up in landfills, where in some cases, they could potentially contaminate groundwater with toxic heavy metals such as lead, selenium and cadmium."

What happens to the forests, plants, wildlife, bees, frogs etc and their habitats when they clear the land?

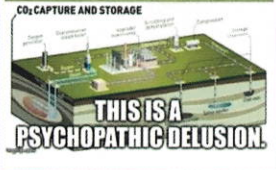

What happens when there is a power outage by fire, wind or over usage of electricity & the grid goes down.

How are you going to keep yourself and family warm or feed your kids during the year?

Come on Victoria! Do not accept your gas being taken away from you, contact your local MP and voice your concerns.

Turbine Blades are NOT biodegradable and need to be replaced every 10 years
